

Variable Speed Drive Chemigation

INJECT-O-METER

Inject-O-Meter® Variable speed drive chemigation systems are simple in design yet built for maximum durability. All systems come with an Inject-O-Meter® positive displacement piston pump for near perfect accuracy. The Variable speed drive allows the output of the pump to be adjusted while unit is in operation. This gives the operator the ease of adjustment in a diaphragm style pump with the simplicity and accuracy in a piston pump. The drive on the chemigation system comes in a NEMA 4X weatherproof enclosure with a start stop switch in order to engage the chemigation system's power. This unit is designed for use with 3 phase or single-phase power. The Inject-O-Meter® chemigation unit comes with all necessary accessories to get started; including, all suction and discharge hoses, fittings, clamps and the Max-94™ chemigation valve. All Inject-O-Meter® chemigation systems are available in a simplex or duplex configuration. From fertilizers to pesticides Inject-O-Meter® can build you a customized chemigation system specifically for your chemigation requirements.
